UNIVERSITY

College of Architecture Engineering & Design
Department of Interior Design

Courses' Descriptions

Programme: Interior Design

Final Award: Bachelor of Science in Interior Design Engineering (4 Years – 142 Cr.H)

Programme started in September 2020-2021

Last Updated Date: January 2021

					L	ST	Lab
AED111	Basic Design Studio I	5	-	3	1	4	0
Course Aims	1- To introduce students to Human-Centered Design in term of proportions 2-To raise the students' awareness about the principles of composition and the basic fundamentals of elements and principles of design 3-To develop the student's skills on creating 2D planar and 3D spatial compositions using sketching, drawing, coloring, crafting and modeling skills 4-To develop the student's visual and verbal communication skills for presenting multiple design proposals						
Course Description:							
<p>The course presents an initiation of human-centered design approach in term of proportion of basic design elements. Through studio, students will apply principles of composition such as proportion, balance, rhythm, contrast, emphasis and hierarchy by forming 2D planar and 3D spatial compositions using different types of elements and materials. These parameters expose student to different scenarios where he/she is supposed to creatively solve problems and generate innovative design ideas. Students are initiated to communicate and debate their design proposals within design reviews and jury sessions</p>							
Course Code	Course Title	NQF Level	Pre requisite	CR.	Teaching Hours		
					L	ST	Lab
AED112	Basic Design Studio II	6	AED131	3	1	4	0
Course Aims	1- To introduce students to Human-Centered Design in term of Human dimensions 2-To enhance the student's skills on creating 2D planar and 3D spatial compositions using sketching, drawing, coloring, crafting and modeling skills 3- To introduce students to the creative manner of solving problems and generating innovative ideas related to the basic parameters of Interior Design 4-To develop the student's visual and verbal communication skills for presenting design proposals and developing students' design portfolio.						
Course Description:							
<p>The course presents a framework of knowledge and sense on elements and principals of design. Students will also experience the fundamental parameters of Interior Design including the human proportions human proportions. It enhances the</p>							

students' visual thinking skills in regard to Program, form, space, structure, context, user and aesthetics. These parameters expose student to different scenarios where he/she is supposed to creatively solve problems and generate innovative design ideas, by forming 2D planar and 3D spatial compositions using sketching, drawing, coloring, crafting and modeling skills. Students shall communicate and debate their design proposals within design reviews and jury sessions to develop their design portfolio

Course Code	Course Title	NQF Level	Pre requisite	CR.	Teaching Hours		
					L	ST	Lab
IDES211	<u>Interior Design Studio I (materiality)</u>	6	AED111	4	2	4	0
Course Aims	1- To introduce students to Human-Centered Design in term of Seating and Circulation comfort and Behavior 2- To familiarize students with the design process and the implementation of space planning 3- To introduce the students to Color theories to apply a selection of harmonized color palette 4- To raise the students' awareness about the implementation of Design Principles in design projects 5-To raise the students' awareness about the proper selection and analysis of structural materials basing on its proprieties and specifications 6-To develop the student's skills on creating an interior space, on designing and selecting furniture, and color scheme to respond to users' needs. 7-To develop the student's visual and verbal communication skills for presenting design proposals and developing students' design portfolio.						
Course Description:							
Materiality in Residential interiors							
The course introduces the design process of interior space including pre-design, schematic design, design development and construction drawings. Students will implement Human-centered design approach to create interior design of residential space. The students will be given a scenario, users' profiles and pre-defined site. The students are requested to analyze the users' needs, given space programing, the site constraints, and the building material proprieties. Students focus on space area and volume calculation to address human ergonomics including scale and proportions, seating and circulation comfort. Throughout, the student shall respect the color theory and design elements distribution and shall select the proper material for the given spatial design project. 2-D and 3-D sketches, technical drawings and colored perspective will be developed to document and present the design project. Discussion, critiques and jury, field trip and investigation of similar environments will be conducted.

					L	ST	Lab
IDES212	<u>Interior Design Studio II</u> (structure)	6	IDES211 +IDES221	5	2	6	0
Course Aims		1- To introduce students to Human-Centered Design in term of human and space dimensions 2- To involve students in the design process from predesign to design documentation phase 3- To develop the students' skills in deriving design concept from the history, Theories and Design Principles 4-To enhance the students' research skills including observing everyday life and deriving information needed in solving design problems 5-To enhance the student's creativity and innovation relative to interior design 6-To develop the student's written, visual and verbal communication skills for presenting design proposals and developing students' design portfolio. 7- To train the students for proper selection of structural system of different spaces.					
Course Description: Structure in Interior Workplaces In this course, the students continue the implementation of design process from predesign to design documentation phase. Students derive design theories, history and principles to inspire creative and innovative concept ideas. Throughout this course, students identify the structural systems of the building and highlight the types of structural and non- structural elements, including floors, walls, ceilings and roofs in addition to furniture and fixtures' structure to be implemented in a given medium-scale interior workplace. The students develop functional interior solutions considering human and space proportions, focusing on assigning furniture, materials and color scheme to respond to users' needs. To derive information needed in solving design problems, students implement evidence-base design approach through conducting various research methodologies including observation from everyday life. 2-D and 3-D sketches, CAD generated layouts and technical drawings will be developed to document and present the design project. Discussion, critiques and jury, field trip and investigation of similar environments will be conducted.

					L	ST	Lab
IDES311	<u>Interior Design Studio III</u> (construction)	7	IDES211+ IDES223	5	2	6	0
Course Aims		<p>1- To equip students with technical skills to implement construction technologies and methods in a given interior space</p> <p>2- To involve students in the design process from pre design to design documentation phase</p> <p>3- To develop the students' skills in deriving design concept from the history, Theories, Design Principles and construction reequipments.</p> <p>4-To enhance the student's creativity and innovation skills to solve interior design problems</p> <p>5-To enhance the students' research skills including data gathering, survey, observing everyday life, appraising and analysing existing buildings in term of function, construction technology and structural system</p> <p>6-To develop the student's written, visual and verbal communication skills for presenting design proposals and developing students' design portfolio.</p> <p>7- Equip the student to select the Structural system, the potential material and finishing solutions within design constraints</p>					
Course Description:							
<p>Construction in welcoming interiors</p> <p>The course investigates advanced space programing and problem solving in hospitality environments. Throughout, the students continue the implementation of design process from pre design to design documentation phase. Students derive design theories, history and principles in addition to construction methods and technology to inspire their innovative concepts and generate creative design ideas. The students develop functional interior solutions and pleasing interior atmospheres considering various types of construction methods and techniques of all kind of interiors' elements, including structural and non-structural elements, and focusing on assigning materials and finishing solutions, adapting appropriate color scheme and structural system to respond to users' needs. To gather data and information needed to begin the project, student conduct research using various methodologies including data gathering, survey, observing everyday life, appraising existing buildings and deriving information. 2-D and 3-D sketches, CAD generated layouts, Computer generated images (CGI) and technical drawings are developed to document and present the design project. Discussion, critiques and jury, field trip and investigation of similar environments is conducted.</p>							

Course Code	Course Title	NQF Level	Pre requisite	CR.	Teaching Hours		
					L	ST	Lab
IDES312	<u>Interior Design Studio IV</u> (Lighting & Acoustics)	7	IDES311	5	2	6	0
Course Aims		<p>1- To introduce students to Human-Centered Design in term of thermal & acoustical comfort</p> <p>2- To develop the students' teamwork skill and potential of cooperation with multi-interdisciplinary professions</p> <p>3- To develop the students' skills in deriving design concept from the history, Theories and Design Principles to implement a systematic design process from predesign to design documentation phase respecting relevant codes and regulations</p> <p>4-To enhance the student's creativity and innovation skills to solve interior design problems</p> <p>5-To enhance the students' research skills including data gathering, survey and analysis, observing everyday life, appraising existing buildings and deriving information needed in solving design problems</p> <p>6-To develop the student's written, visual and verbal communication skills for Judging design proposals, presenting design-freeze panels and developing students' design portfolio.</p> <p>7- Train the students for applying lighting & acoustical calculations and developing MEP systems for the project.</p>					
Course Description:							
Lighting & Acoustics in Commercial interiors							
<p>The course investigates advanced space programing and solving design problems in commercial Interior environments, with focus on lighting and acoustics principles and its user 'quality' assessment of illuminated spaces including control of glare, Daylight and artificial and sustainable lighting strategies, and interior space illumination calculations & acoustic theories including specifications of materials and products of acoustical solutions. Students shall apply the esthetical and functional design principles and human centered design approach in term of thermal comfort of space users. Throughout, the students work in team and cooperate with multi-interdisciplinary professions; continuing the implementation of design process from predesign to design documentation phase, respecting relevant codes and regulations regarding electricity and plumbing services. Students derive modern history and theories of design to inspire their innovative concepts and generate creative design ideas. The students shall consider the structural system and the construction technologies of the given existing building, focusing on assigning materials and finishing solutions, adapting appropriate color scheme to respond to users' needs. To gather data and information needed to begin the project, student</p>							

conduct research using various methodologies including data gathering, survey, observing everyday life, appraising existing buildings and deriving information. 2-D and 3-D sketches, CAD generated layouts, Computer generated images (CGI), technical drawings, BOQ and working drawing documents will be developed to document and present the design project. Discussion, critiques and jury, field trip and investigation of similar environments will be conducted.

					L	ST	Lab
IDES411	<u>Interior Design Studio V</u> (ventilation)	8	IDES312 +IDES323	5	2	6	0
Course Aims		<p>1-To enhance the students' skills related to planning and managing large scale public projects through the implementation of a systematic design process and respecting construction laws, codes and regulations</p> <p>2- To develop the students' collective presentation skill and potential of cooperation with multi-interdisciplinary professions</p> <p>3- To develop the students' skills in evaluating interior design proposals and alternatives from precedent work, deriving and evaluating history, theories and principles of design to inspire innovative design concepts</p> <p>4-To enhance the students' research skills including data gathering, survey and analysis, observing everyday life, investigation, appraising existing buildings and deriving information needed in solving design problems</p> <p>5-To develop the student's written, visual and verbal communication skills for Judging design proposals, presenting design-freeze panels and developing students' design portfolio.</p> <p>6-Train the students for developing ventilation systems in the large-scale project.</p>					
Course Description:							
Ventilation in Public Interiors							
<p>The course investigates advanced space programming, planning and management of large-scale public Interior environments, with focus on applying and evaluating existing A/C and Ventilation systems including mechanical, natural, mixed made and artificial ventilation within the public interior space. The student evaluates design alternatives and strategic design decisions that consider the business model, economic, social and cultural contexts. The course integrates all design aspects; functionality, aesthetic values, appropriate construction technologies and materials, laws, regulation and codes, social and wellbeing impact. Throughout, the students illustrate the project as collective presentation and cooperate with multi-interdisciplinary professions; continuing the implementation of design process from</p>							

pre design to design documentation phase, respecting relevant codes and regulations. Bill of quantity preparation, project specification, time scheduling and suppliers' list are applied within the project management framework. Students derive modern history and theories of design to inspire their innovative concepts and generate creative design ideas to respond to users' needs. The students shall provide professional and detailed working drawing documents, technical plans and installation layouts respecting international codes and regulations. To gather data and information needed to prepare the inquiry report, student conduct research using various methodologies including data gathering, survey, observing everyday life, appraising existing buildings and deriving information. 2-D and 3-D sketches, CAD generated layouts, Computer generated images (CGI), animated video, technical drawings, working drawing layouts and construction administration documents will be developed to present the design project. Discussion, critiques and jury, field trip and investigation of similar environments will be conducted.

IDES412	Interior Design Graduation Project I	8	IDES351+IDES324	2	0	2	0
Course Aims		1-To equip students with analytic skills to utilize their technical knowledge related to site measurements and recording, sustainability, building systems, construction methodologies, materials and services to be able to identify design guidelines 2- To develop the students' team work skill and the potentiality of cooperation with multi-interdisciplinary professions through conducting questionnaires and survey for potential space users in particular and the community in general 3- To develop the students' skills in evaluating interior design proposals and alternatives from precedent work, deriving and evaluating history, theories and principles of design to identify research problems and find out the appropriate research goals 4-To introduce students to advanced research methodologies including data gathering, survey and analysis, observation from everyday life, investigation, cases of study analysis, appraising existing buildings and deriving information needed in formulating the design brief 5-To develop the student's written and verbal communication skills for Judging design proposals and presenting research reports 6- Raise the students' awareness about the professional context of the Capstone project creating design solutions which respect construction laws, codes and regulations					
Course Description:							
A seminar course is offered to students to assist them in preparing the research report for the capstone project which is considered as the pre-design phase. The selection of the project topic shall be in accordance with the student's area of interest and selected career path which is derived from career-elective and training courses, mentioning furniture, adaptive transport							

and scenography design. Within this course the student come up with an innovative topic which respects human, cultural, environmental, professional and economic contexts. The student conduct a research using multiple methodologies including data gathering, survey and analysis, observation from everyday life, investigation, cases of study analysis, appraising existing buildings and deriving information needed in formulating the design brief later on. The students evaluate interior design proposals and alternatives from precedent work, derive and evaluate history, theories and principles of design to identify research problems and find out the appropriate research goals. The students utilize technical knowledge to identify design guidelines with respect to construction laws, codes and regulations in order to create research solutions. All this gathered data is compiled and then analyzed to formulate the final research report which is presented in front of a panel in a jury session.

					L	ST	Lab
IDES413	<u>Interior Design Graduation Project II</u> (Holistic)	8	IDES412+ IDES411	5	2	8	0
Course Aims		<p>1-To enhance the students' skills related to planning and managing large scale Capstone projects through the implementation of a systematic design process and respecting construction laws, codes and regulations</p> <p>2- To develop the students' professional team work and collective presentation skill and potential of cooperation with multi-interdisciplinary professions attributing in adding the leadership expertise to his/her personality</p> <p>3- To develop the students' skills in setting criteria and evaluating interior design proposals and alternatives from precedent design works, deriving and evaluating history, theories and principles of design to inspire innovative design concepts</p> <p>4-To enhance the students' research skills including data gathering, survey and analysis, observing everyday life, investigation and inquiry, appraising existing buildings and deriving information needed in solving design problems</p> <p>5-To develop the student's written, visual and verbal communication skills for Judging design proposals, presenting design-freeze layouts and developing students' design portfolio.</p> <p>6- To provide students with the opportunity of developing a holistic interior design engineering project.</p> <p>7- To develop the student's skills related to space programming, layout and planning interior space, designing and selecting furniture, lighting and color palette to achieve functional and sustainable interior design solutions with overcoming the design constrains while creating social and pleasing atmosphere with visual character and identity.</p>					
Course Description:							
Holistic Design							
The graduation project requires the student, under the supervision of a faculty member, to							

integrate and present all Engineering knowledges (Structural systems, ventilation, illumination, acoustics, construction technology, installation methods, materials specification), thinking, practical and technical skills, attributes and competences gained throughout the study of the program in a comprehensive and self-directed interior design project in accordance with his/her emerging interest and prospected career plan. The student is required to identify the capstone project theme, its design problems, and to set its design criteria and find out its appropriate solutions. Emphasis is giving on the full awareness of professional practice, creativity and originality of the design proposals, satisfying all design criteria & consolidations and adherent to relevant standards and codes (local and international building regulation and guidelines for construction, product and materials, Bahrain building regulations and barrier-free and accessibility regulations). Spatial design environments will be fully developed. CAD generated layouts, Computer generated images (CGI), animated video, technical drawings, working drawing layouts and construction administration documents will be developed to present the design project. Discussion, critiques and jury, field trip and investigation of similar environments will be conducted

IT102	Introduction to Computer Applications	5	-	2	1	0	2
<p>Course Description:</p> <p>The course divided to theory and practical parts.</p> <p>Theoretical Part:</p> <p>It presents an introduction to computer and information technology, and the basic computer concepts. This subject introduces survey of computers and information processing and their roles in society. It also introduces a historical perspective of computing, hardware, software, information systems, and human resources and explores their integration and application in business and other segments of society. It explains the binary number systems used in the computer systems, different types of computers, different types of hard ware, different types of software, different types of computer networks, and how is internet works and how to use web.</p> <p>Practical Part:</p> <p>Training students to use Microsoft Word, Excel and PowerPoint Applications in intermediate level.</p>							

Course Code	Course Title	NQF Level	Pre requisite	CR.	Teaching Hours		
					L	ST	Lab
AED121	Engineering Mathematics	5	Math095	3	2	2	0
Course Aims		<p>To raise the awareness of students about potential of mathematics in Engineering discipline.</p> <p>To enhance mathematical and scientific skills of students.</p> <p>To Increase the cognizance of students about basic algebra and calculus and their engineering applications.</p> <p>To identify, formulate and solve engineering problems.</p>					
<p>Course Description:</p> <p>The course prepares students to develop their basic concept of mathematics and its applications in engineering disciplines. The course work includes matrices operations and methods to solve engineering problems, system of linear equations, trigonometric functions and applications, it covers also the fundamentals of differentiation and integration and their applications in engineering area. The course will cover the basic knowledge and skills of mathematics needed for the next levels of study.</p>							

Course Code	Course Title	NQF Level	Pre requisite	CR.	Teaching Hours		
					L	ST	La b
IDES121	Mathematics for Interior Design Engineering	6	AED121	3	2	2	0
Course Aims		1-To refresh the students' knowledge of mathematics and geometry skills that required for quantity surveying. 2- To raise the students' awareness about mathematics' applications in interior design, including site measuring, plan stick-out, quantity and cost estimation and business plan. 3- To familiarize the students with measurement systems and standard units. 4- To develop the students' skills of data classification analyzation and interpretation.					
Course Description:							
<p>This course introduces the mathematical process that are required for interior design engineers. The students recall and enhance their knowledge and skills of algebra and geometry with its practices for interior design process and interior design engineering business. The course subjects help the students to know the various types of measurement systems and standard units, they convert values from measurement system to another and from unit to another. The students practice geometry and mathematic principles to calculate area, volumes and dimension of regular and irregular shapes and forms. They measure the site, stick-out the plans. Moreover, students apply mathematical and geometrical formulas to calculate the quantity of interior materials and estimate the interior design project cost including materials, manufacturing, labor, taxes and fixed cost. The course also introduces the statistical functions of numerical values that necessary to classify, analyze and interpret surveyed quantitative information.</p>

					L	ST	Lab
AED122	Building Physics & Material Properties	6	-	3	3	0	0
Course Aims		1- To develop knowledge on principles of physics in relation to lighting, acoustics, airflow, fluid dynamics and heat transfer. 2- To develop knowledge on thermal, optical, acoustical of building materials 3- To develop awareness of influence of basic physic in design related discipline					
Course Description:							
<p>This course contains two main parts. In the first, the students recall their knowledge of physics relative to buildings, such as heat transfer, light properties, sound behavior, airflow, and fluid mechanics. The course provides an understand physics and their influences and application in the building design. In the second part, the subject will cover aspects of thermal, optical, acoustical properties of building materials. The knowledge on material properties will enhance their understanding of selecting material for different requirements of the design.</p>							

Course Code	Course Title	NQF Level	Pre requisite	CR	Teaching Hours		
					L	ST	Lab
IDES221	Structural Systems for Interiors	6	IDES122	3	2	2	0
Course Aims		1-To raise the students' awareness about structural principles of interior elements. 2- To develop the students' knowledge of suitable structural systems of interior elements. 3- To familiarize the students with code and specifications of structural materials 4- To build the students sense of structural through design proposal testing. 5- To enable students for selecting the proper structural system and materials for spatial design project.					
Course Description:							
<p>This course introduces the structural principles of interior elements including floors, walls, ceilings and roofs in addition to furniture and fixtures' structure. The student study forces, strengths, loads, materials, structural members and construction methods of various types of structural systems. The code and specifications of structural materials are subjects of study within this course. The course builds the students sense of structure through set of experiments in the workshop. They evaluate their design proposals in term of materials strength, structure stability, balance and support.</p>							

Course Code	Course Title	NQF Level	Pre requisite	C R.	Teaching Hours		
					L	ST	La b
IDES222	Building Physics & Components	6	AED122	2	1	0	2
Course Aims		1-To refresh the students' knowledge of physics such as heat transfer, light properties, sound behavior, airflow and fluid mechanics. 2- To raise the students' awareness about physics applications in building. 3-To introduce the students to the basic knowledge of building systems. 4- To familiarize the students with components and functions of each building system and services. 5- To develop the students' skills of reading technical drawings related to all building systems. 6- To build the students capacity of linking sustainability with building systems.					
Course Description:							
<p>This course contains two main parts. In the first, the students recall their knowledge of physics relative to buildings, such as heat transfer, light properties, sound behavior, airflow, and fluid mechanics. The students know and understand the physics applications in building. In the second part, they study the main components and functions of various types of building systems; including illumination, acoustical, structural, constructional, electrical, communication, HVAC, plumbing, firefighting, and interior transportation systems. Technical drawings of such systems are presented to students to learn technical terminology, symbology and layout principles. The students explore the link of sustainability, human comfort, safety and wellbeing to the functions of building systems as an introduction to courses concerned with design of building systems.</p>							

Course Code	Course Title	NQF Level	Pre requisite	CR.	Teaching Hours		
					L	ST	Lab
IDES223	Interior Lighting & Acoustics	7	IDES222	2	1	2	0
Course Aims		1- To refresh the students' knowledge of building physics 2- To raise the students' awareness of lighting and acoustics theories and principles. 3- To aware students with materials and products of lighting and acoustics solutions. 4- To equip the students for lighting and acoustics teasing and calculations in the buildings. 5- To help students developing sustainable solution through successor design studio.					
Course Description:							
<p>This course begins with a revision of building physics related to light and sound wave. it introduces students to two subjects, in the first part of this course, the students are introduced to theory and principles of light including, electro-magnetic spectrum, Photometric concepts and units of measurement, electric lamp technologies including lamp's types, colors and other specifications, psychological impact of lighting, User 'quality' assessment of illuminated spaces including control of glare, Daylight as an alternative to electric light, substantiable lighting strategies, and interior space illumination calculations. the second part of this course introduces students to acoustic theory and principles applicable to interiors such as the decibel scale, sound power, sound pressure, wave propagation, sound waves' reflection and refraction. Moreover, they study description and specifications of materials and products of acoustical solutions. Students conduct laboratory experiments and field testing to explore sound insulation values and identify sound transmission paths in buildings. The students practice the lighting and acoustics to provide standard technical documentations illustrate lighting and acoustics solutions and details for theaters and/or auditorium buildings taking into consideration the relevant cods and guidelines site environmental context, safety, comfort, and human wellbeing.</p>							

Course Code	Course Title	NQF Level	Pre requisite	CR.	Teaching Hours		
					L	ST	Lab
IDES321	MEP systems for Interiors	7	IDES222	2	1	2	0
Course Aims		1-To raise the students' awareness of mechanical, plumping and electrical systems and relative sub-systems. 2- To provide students with necessary knowledge subjective descriptors of buildings systems components. 3- To equip the students to develop technical drawings and details of building components related to MEP systems. 4- To prepare students for creating sustainability-based design solutions with respecting codes, standards and guidelines.					
Course Description:							
<p>This course introduces the students to mechanical, plumping and electrical systems in interior spaces. the course contains: Mechanical sub-systems that are not limited to gods' transportation, lefts, escalators, mechanical veneration and water pumps; Plumbing sub-systems which are not limited to water supply, drainage, water-based firefighting, tanks, and sanitary fixtures; Electrical sub-systems that are not limited to artificial lights, power supply, telecommunication, mentoring, internal sound, fire alarm. Students study such system's components in terms of products, specifications, structure, symbology, and</p>							

execution principles. Students learn how to assign and select each single component from perspective of sustainability, codes, regulations, standard and guidelines to achieve safety, human wellbeing and comfort. They integrate each sub-system components into design of interior spaces to produce technical working drawings such as layout, and scheduling including quantity, description, specification, cost, brand, finish and color. Students explore such systems through sets of site trips and experts' meetings.

Course Code	Course Title	NQF Level	Pre requisite	C R.	Teaching Hours		
					L	ST	Lab
IDES322	Interiors Design Technology & Construction	7	IDES221	3	2	2	0
Course Aims		1-To raise the students' awareness of building construction methods. 2- To equip the students for developing technical drawings and details of building components. 3- To provide students with necessary knowledge of latest technologies affecting the interior design. 4- To prepare students for creating technology-based design solutions. 5- To enhance the students' skills of utilizing latest technologies in design process.					
Course Description:							
<p>This course introduces the students to two main subjects, first is the knowledge of the interior construction method and second is latest technologies affecting the interior design solutions. In the first subject, the students study various types of construction methods and techniques of all kind of interiors' elements, including structural and non-structural elements. That equips them for understanding and developing technical drawings and details of building components. The second subject introduces latest technologies those have impacts on the interior designs. The students obtain knowledge of how communication and information revolution lead to smart house projects, tiny house movement lead to futuristic design, virtual and augmented reality kits help designers and owners to stimulate the interior spaces, and 3D printing, scanning and cutting technologies are powerful for mass production.</p>							

Course Code	Course Title	NQF Level	Pre requisite	CR.	Teaching Hours		
					L	ST	Lab
IDES323	HVAC systems for Interiors	7	IDES322	3	2	2	0
Course Aims		1- To develop the students' knowledge of environmental factors affecting design decision. 2- To raise the students' awareness of HVAC systems and components. 3- To provide the students with better understanding of technical services requirements in the interior spaces. 4- equip the students for assigning HVAC systems for different building. 5- To develop the students communication skills through reading and creating technical working drawings.					
Course Description:							
<p>The course introduces the students into advanced background of human physiology and thermal comfort, natural ventilation and orientation of buildings, global climatic factors, elements and classification of climate, thermal balance of the body, comfort scales, heat exchange of buildings, solar geometry. Moreover, providing detailed knowledge of the three systems of HVAC: Heating systems in the building</p>							

including central hot water heating and space warming; Ventilation system including mechanical, natural, mixed made and artificial ventilation; Air conditioning systems including window, split, Packaged, central, district cooling and chilled beam systems. The course provides principles of such system layouts, mechanism, theory of operation and technical details of its components. With respecting building codes, standards and sustainability guidelines, the students review exiting building and respond to design brief by selecting the suitable HVAC system for various categories of interior spaces considering building location, orientation, function, size, capacity and user activities in the building to achieve human wellbeing. The students communicate the HVAC system with others via reading and developing technical drawings of such systems.

IDES324	<u>Codes for Interior Design Profession</u>	7	IDES322	2	1	2	0
Course Aims		<ol style="list-style-type: none"> 1- Develop students' awareness about code of conduct of local and international interior design profession. 2- Raise the students' awareness about Bahrain buildings permit Procedures. 3- Train students to explore the standards related to Interior Design in Unified Guidebook of Building Permit Regulations in Bahrain. 4- develop the students' recognition of codes, standard and requirements for Bahrain buildings permit, including safety, water conservation, thermal insulation in various types of buildings. 5- Raise the students' awareness about local and international building assessment criteria for green buildings and sustainability 					
Course Description:							
<p>This course introduces the students to local and international code of conduct of interior design profession, including responsibilities to society, building owner, contractor and interior designer. It also introduces the students to unified guidebook of building permit and regulations of Bahrain, particularly those are related to interior design scope of works including signages, circulations, installation, materials, and constructions to adhere requirements of building permit regulators, including requirements for safety, water conservation, thermal insulation, sustainability, and human wellbeing in various types of buildings. In the course, the students also study criteria of green buildings ratings systems including LEED, BREEAM, Green Globes, Living Building Challenge, NZEB, Passive House Institute US, SITES, WELL Building Standard. Practices of buildings codes is part of practical part of this course to benchmark a provides design with building codes and sustainability requirements.</p>

IDES421	<u>Finishing Materials, Color and Texture</u>	8	IDES222	3	2	2	0
Course Aims		1-To raise the students' awareness of finishing materials specifications and properties.					

	2- To enhance the students' skills of finishing materials teasing and exploration. 3- To train the students on materials selecting to achieve designs' objectives.
--	---

Course Description:

This course concerned with three main subjects; it starts introducing the finishing materials properties and specifications in terms of sources, locations, shapes, strength, workability, functionality, durability, sustainability, environmental compatibility, color, texture and construction technology of each. The second subject is teasing various types of available finishing materials in Bahrain markets, third part is focusing on principles of assigning materials for various building elements such as floors, walls, ceilings, stairs, doors, windows, furniture and other structural elements of interior spaces in various types of buildings. The course emphasizes on the applications of interior finishes and materials in the context of their relations with aesthetic values and visual expressions, human wellbeing and comfort, health and safety factors, and environmental impacts and codes.

IDES422	<u>Smart & Sustainable Green Technologies</u>	8	IDES323	3	2	2	0

Course Aims	<ol style="list-style-type: none"> 1- To understand the notion of smart technology in interior design 2- To understand the notion of sustainable green technology in interior design 3- To recognize and explore the smart technology elements, the green and sustainable principles of interior design 4- To define the <u>sustainable</u> issues in an interior environment 5- o awareness the advanced smart technology tools/systems/devices/sensors/material and its applications in various interior design
--------------------	--

Course Description:

The course offers students theoretical knowledge and practical opportunity to discover the sustainable principles and the smart and green technologies in interior design for buildings that use integrated communication systems to manage the performance of the indoor environment and to support the quality lifestyle choices of the occupants. The course of smart & green sustainable technologies focuses on the integration of social, digital communication, technological, economic, and environmental sustainability in interior design projects. Students apply the different communications, safety & security, energy efficiency, materials, thermal comfort, water usage, low-carbon emissions, health & well-being to minimize environmental impact and achieving sustainability for assigned project.

Communication Domain

Course Code	Course Title	NQF Level	Pre requisite	CR	Teaching Hours		
					L	ST	La b
ENGL103	English for Academic Purposes I	5	ENGL010	3	3	0	0
Course Aims		1- To focus on diction, sentence structure, punctuation and mechanics required for varied professional communication. 2- To improve critical reading and listening in the formal context. 3- To express ideas fluently in a well-organized manner.					
Course Description:							
This is an introductory course that prepares the students to communicate in correct English for academic and professional purposes. Students enhance their reading, writing, listening as well as speaking skills through classroom activities and compose ideas in varied specified formats. This course will help the students to develop contextual analysis, teamwork, word processing, documentation and professional communication.							

Course Code	Course Title	NQF Level	Pre requisite	CR	Teaching Hours		
					L	ST	La b
ENGL104	English for Academic Purposes II	5	ENGL103	3	3	0	0
Course Aims		1. To be able to express ideas at an academic level and respond to associated questions. 2. To enhance reading and writing skills for academic and business purposes. 3. To improve competent speaking skills using effective delivery strategies					
Course Description:							
This is a course that develops the interpretative skills related to listening, speaking, reading and writing tasks that constitute professional communication. This course covers a process-based approach namely brainstorming, drafting, developing, revising as well as editing in writing and speaking tasks, plus skimming as well as scanning for the interpretation of the text in reading and listening tasks systematically. This course helps the students describe events, make comparisons and express their preferences and recommendations.							

Course Code	Course Title	NQF Level	Pre requisite	CR	Teaching Hours

AED331	BIM for Design and Construction drawing	7	AED231	3	2	0	2
Course Aims		1- To aware students with BIM technology and its application on the design process. 2- To train students on utilizing BIM applications for developing architecture and design projects. 3- To equip students with digital visualization skills that help them in project-based courses.					
Course Description:							
<p>The course introduces students to the principles of Building Information Modeling (BIM) such as the Autodesk ® Revit Architecture application. Students have knowledges of functions of menus, options and tools of Revit Architecture including user interface, straight and flexing parameters, system and non-system families, massing, components of building elements such as walls, windows, doors, floors, roofs, stairs, ramps and ceiling. It is a training-based course enable students to create design ideas, asses building models in terms of lighting, shadow, heating, and veneration, and communicate the designs through producing rendered perspectives, animated senses, complete sets of working drawings, shop drawings, building details and construction documents such as BoQ and quotations. students practice building information modeling technology to visualize, stimulate, document and assess spatial design projects in which architecture engineering students focus on forms, spaces, building envelop, landscape and structure of building elements, while Interior design students focus on space, finishing materials, furniture and lighting and building elements' surfaces designs.</p>							

Course Code	Course Title	NQF Level	Pre requisite	CR.	Teaching Hours		
					L	ST	Lab
IDES331	BIM for Services and Interior Detailing	7	AED331	3	2	0	2
Course Aims		1- To aware students with BIM technology and its application on the holistic design process. 2- To train students on utilizing BIM applications for developing architectural details and building systems. 3- To equip students with collaboration, coordination and managerial skills.					
Course Description:							
<p>The course introduces the principles of Building Information Modelling to integrate architectural, structural, mechanical, plumbing and electrical objects in interior modules. It continues to introduce the students to furthered BIM utilization for developing details of building elements and layouts of services systems. Students practice BIM technology to develop callouts of different building's elements to illustrate flooring layers; partition walls' structure; water, sound and heat insulations; and subassemblies of doors, windows, furniture and curtain walls. They also practice BIM technology to develop HVAC, Mechanical, Electrical and Plumbing system layout plans. Thus, they can coordinate the project and collaborate with the design team to avoid conflicts and achieve holistic design solutions.</p>

IDES241	History and Theories of Art and Design	6	ENGL104	3	2	2	0
Course Aims		1-To raise the students' awareness about the basic architectural and interior design elements, as well as the design aesthetic aspects and principles to be considered in designing interior spaces. 2-To introduce students to the various Human Centered design approaches and its application in Interior Design 3-To introduce the students' to color vocabulary and color theory and its application in interior spaces					

	<p>4-To raise the students' perception and awareness about the role of colors and design elements in creating a harmonious and visual balanced interior space.</p> <p>5-To introduce the students to design movements and schools in the 17th and 18th centuries.</p>
--	---

Course Description:

This course introduces the physical and aesthetical principles implemented in the design of interior spaces. It stresses on the theory of design and its influences in the formation of comfortable interior environments. It focuses also on Color theories, vocabulary, its relation with lighting principles and its application to create visually pleasing Interior atmospheres. In addition, the course provides an overview, within a chronological framework, on the evolution of the 17th and 18th centuries. Applications include Conceptual thinking in the history of art, architecture and interior design. Socio-cultural aspects are highlighted in the course with emphasis on its impact on the Human lifestyle.

Course Code	Course Title	NQF Level	Pre requisite	CR.	Teaching Hours		
					L	ST	Lab
IDES242	Modern History of Architecture, Art, & Design	7	IDES241	3	2	2	0

Course Aims

1-To introduce the students' to the architectural and design schools and styles in the 19th and 20th century.

2-To underline the cultural, social, technological and economic aspects during the 19th and the 20th centuries and its impact on creating contemporary design contexts

3-To raise the students' awareness about the design pioneers in modern architecture.

Course Description:

The course introduces the students to the development of the emerged architecture and design schools and styles in 19th century and 20th centuries that influenced and formed the modern History of design, architecture, decorative arts and arts creating modern Interior design styles. Cultural, social, technological and economic aspects are stressed within this course. Thus, the students are required to analyze and evaluate historical and ancient Interior environments through searching for case of studies, reporting and presenting texts. Then, they are able to apply this knowledge in forming design concepts which are inspired from the taught design styles and respond to the design thinking of the pioneers of these styles.

Course Code	Course Title	NQF Level	Pre requisite	CR.	Teaching Hours		
					L	ST	Lab
IDES341	Global Contemporary Interior Architecture	8	IDES242	2	1	2	0

Course Aims

1-Introduce the students' to the existing, occurring and famous movements in the profession of Interior Architecture

- 2-Raise the students' awareness about the most recent and well-known projects, firms, designers and experimental work.
- 3-Familiarize the students with the relation between contemporary design concepts and emerged technology approaches with economic, social and cultural contexts
- 4-To equip students with analytic skills to evaluate creative precedents work and appraise existing interiors in term of function, psychology and economy; relating the significance of these designs with the enhancement of human life quality and development of communities.

Course Description:

The course addresses the existing, occurring and current popular trends in the profession of interior architecture. The course investigates the most recent interesting local, regional and international interior design project, well known interior design/architecture firms, celebrated designers, and experimental work. Multiple design concepts and emerged technology approaches are discussed in theoretical lectures to identify the relationship between design and economic, social, cultural, geographical, political, environmental, ecological contexts of contemporary architecture. Student is asked to analyze and evaluate creative precedents work and appraise existing interiors in term of function, psychology and economy in order to relate the significance of these designs with the enhancement of human life quality and development of communities.

IDES362	Design for TV Studio Set	7	IDES361	2	1	2	0
Course Aims	1-Introduce students to the fundamentals and theories of studio set design 2-Introduce students to the historical background of studio set design and the socio-cultural contexts of its creation 3-Familiarize students with technical consideration of studio design						

such as light and acoustics, camera direction and furnishing assembly.

4-Familiarize students with the aesthetical design principles in the field of TV set design such as color palette, finishing materials and decorative elements selections to assemble an adequate visual language

5-Familiarize students with the functional aspects of TV set design such as the show type (news, entertainment, comedy, arts, music or game shows), space occupation (presenter, guests, and audience) and visual angles.

6-Enhance the students' visual and verbal communication skills through the production of the storyboard, the furnishing plan, the technical drawings and the Computer Generated 3Ds.

Course Description:

This course presents a theoretical framework of studio design discipline including fundamentals theories and historical background of the manifestation of TV set design. The students apply the theoretical knowledge gained in the first weeks of the semester by developing one mini project: Television Studio throughout the second part of the semester. The students are introduced to various aspect of studio set design; mentioning **the functional aspects**: the studio activity, space occupation, visual angles; **technical aspects**: architectural venue, lighting resources, acoustical isolation, furnishing assembly and camera directions; and **the aesthetical aspects**: finishing materials, color palette selection, decorative elements in order to assemble an adequate visual language. At the end of the semester, the students utilize visual and verbal communication skills to present the final project of a specific show including the storyboard, the furnishing plan, the technical drawings, the Computer Generated 3Ds and 3Ds animation film.

Course Code	Course Title	NQF Level	Pre requisite	CR.	Teaching Hours

IDES363	<u>Furniture Structure & Materials</u>	7	IDES212 + IDES141	2	1	2	0
Course Aims	<ol style="list-style-type: none"> 1- To raise the students awareness about the importance of the form and shape to create stable and functional furniture pieces 2- To familiarize students with the variety of materials and finishing applicable for furniture design 3- To introduce students to technical drawings of different structural systems of a furniture product. 						

Course Description:

The course provides the basic principles of furniture structures and its relationship with the form and shape of these products. Students are asked to develop CAD generated drawings showing the detailed morphology of the furniture pieces and its nomenclature. This course focuses also on the various types of furniture materials and its finishing layers as well as its properties and the importance of these parameters to create a stable and functional furniture piece. A basic prototype model of a furniture piece is produced at the end of the semester using its real materials and applying the theoretical knowledge gained during the course to provide an accurate structural system of the product design and supported by technical drawing and design documentations.

Course Code	Course Title	NQF Level	Pre requisite	CR.	Teaching Hours		
					L	ST	Lab
IDES364	Furniture Detailing	7	IDES363	2	1	2	0

Course Aims

- 1- To raise the students awareness about the variety of joint details and its application in furniture pieces
- 2- To equip students with skills to produce scaled and proportional technical documentation for furniture design projects
- 3- To familiarize students with professional presentation of technical detailing of furniture pieces
- 4- To equip students with the technical skills to generate comprehensive and detailed working drawing documents for furniture design projects

Course Description:

The course provides a deep knowledge about the various types of furniture joints and its application and use in products. The courses emphasizes also on improving the students representation skills in regards to furniture detailing including the drafting of scaled and proportional technical documentation and professional drawings. Herewith, students apply the theoretical knowledge to produce comprehensive technical details. Detailed working drawings documents are developed by students within the semester and visual presentation are conducted.

IDES365	<u>Recycling & Conservation Methods</u>	7	IDES212 +IDES141	2	1	2	0
Course Aims	<ol style="list-style-type: none"> 1- To introduce students to recycling basics and methods 2- To raise students awareness about the benefits of recycling to the human wellbeing, the environment preservation and the community enhancement 3- To raise the students awareness about the importance of conserving interior spaces a main principle of recycling principles 4- To familiarize students with relevant sustainability regulations and rehabilitation codes 5- To equip students with technical skills to take accurate measurements and to produce detailed working drawings documents of interior environments to be conserved 						
Course Description:							
<p>This Course is a theoretical framework of the principle methods of recycling and conserving within interior environments. It includes a deep introduction about sustainability approach and its respective techniques. This course highlights also environmental aspects in the field of conservation and recycling such as human wellbeing, environment preservation and community enhancement. It focuses on relevant sustainability regulations and rehabilitation codes and its application in interior environments. Throughout this course, the student is exposed multiple examples of old interior spaces to be conserved and is asked to take accurate measurements of its structural system and produce detailed working drawings documents.</p>							

Course Code	Course Title	NQF Level	Pre requisite	CR.	Teaching Hours		
					L	ST	Lab
IDES366	<u>Structure & Materials of Transportation means</u>	7	IDES365	2	1	2	0
Course Aims	<ol style="list-style-type: none"> 1- Introduce students to the variety of product and finishing materials used in transportation means, its terminologies and respective specifications 2- Familiarize students with the typology and nomenclature of the different transportation means 3- Introduce students to the diversity of structural systems within transportation means 4- Raise the students awareness about the multiple factors affecting the design of transportation means mentioning environmental conditions, safety precautions, structural 						

load, functional and aesthetical enquiries

Course Description:

Throughout this course, students are introduced to the variety of transportation means which can be transformed to Interior environments with specific function, the typology and nomenclature of this precise type of interior environment is revealed during this course. Focus is directed to marine, air and land transportations means because of its particular considerations and large usage. Within this course, multiple transportation product and finishing materials are exposed with its specific market terminologies and respective specifications. Technical issues are explained mentioning the diversity of structural systems and the calculation of the bearing load ensuring the structural integrity of the transportation mean as an interior space. Students are exposed to different aspects affecting the design of this specific type of environments mentioning environmental conditions (thermal, acoustical and lighting factors), safety precautions, functional and aesthetical enquiries.

					L	ST	Lab
IDES461	Design for Cinema Set	8	IDES362	2	1	2	0
Course Aims	1-Introduce students to the fundamentals and theories of cinema set design 2-Introduce students to the historical background of cinema set design and the socio-cultural contexts of its creation 3-Familiarize students with technical consideration of cinema set design such as light and acoustics, camera direction, visual angles, scenery construction and location film work 4-Familiarize students with the aesthetical design principles in the field of cinema set design such as color palette, textile, finishing materials and decorative elements selections to gather the appropriate visual language needed for the scenes 5-Familiarize students with the functional aspects of cinema set design such as script breakdown and character analysis 6-equip students with the skills needed to perform a script analysis technique necessary to gather visual information required for the design 7-Enhance the students' visual and verbal communication skills through the production of the storyboard, the furnishing plan, the technical drawings and the Computer Generated 3Ds.						
Course Description:							

This course presents a theoretical framework of cinema design discipline including fundamentals theories and historical background of the manifestation of TV set design. The students apply the theoretical knowledge gained in the first weeks of the semester by developing one mini project: multi-camera cinema Studio throughout the second part of the semester. The students are introduced to various aspect of cinema set design; mentioning **the functional aspects**: script breakdown and character analysis; **technical aspects**: light and acoustics, camera direction, visual angles, scenery construction and location film work; and **the aesthetical aspects**: color palette, textile, finishing materials and decorative elements selections needed to gather the appropriate visual language needed for the scenes. At the end of the semester, the students utilize visual and verbal communication skills to present the final project of a specific cinema scene including the storyboard, the furnishing plan, the technical drawings and the Computer Generated 3Ds.

IDES462	Design for Stage Set	8	IDES362	2	1	2	0
Course Aims	1-Introduce students to the fundamentals and theories of stage design 2-Introduce students to the historical background of theatre design and the socio-cultural contexts of its creation 3-Introduce students to the types of traditional stage including Proscenium, Thrust, and Arena 4-Familiarize students with technical consideration of stage design such as light and acoustics, camera direction, sound system and scenery construction 5-Familiarize students with the aesthetical design principles in the field of stage design such as color palette, textile, finishing materials and decorative elements selections to gather the appropriate visual language needed for the scenes 6-Familiarize students with the functional aspects of stage design such as script breakdown and character analysis 7-equip students with the skills needed to perform a script analysis technique necessary to gather visual information required for the design 8-Enhance the students' visual and verbal communication skills through the production of the storyboard, the furnishing plan, the technical drawings and the Computer Generated 3Ds.						
Course Description:							

This course presents a theoretical framework of theatre design discipline including fundamentals theories and historical background of the manifestation of theatre design as well as its traditional types. The students apply the theoretical knowledge gained in the first weeks of the semester by developing one mini project: Four play scripts or one man show or opera or dance theater scene throughout the second part of the semester. The students are introduced to various aspect of stage design; mentioning **the functional aspects**: script breakdown and character analysis; **technical aspects**: light and acoustics, camera direction, sound system and scenery construction; and **the aesthetical aspects**: color palette, textile, finishing materials and decorative elements selections needed to gather the appropriate visual language needed for the scenes. At the end of the semester, the students utilize visual and verbal communication skills to present the final project of a specific stage scene including the storyboard, the furnishing plan, the technical drawings, the Computer Generated 3Ds, and blocking diagrams.

IDES463	Furniture Production Technology	8	IDES364	2	1	2	0
Course Aims	<ol style="list-style-type: none"> 1- To introduce students to the variety of furniture production technologies such as batch, serial, prototyping and personalized furniture production 2- To introduce students to smart and sustainable production concepts and its application in furniture design field 3- To raise the students awareness about the importance of prototyping as a prior step for furniture production 						
Course Description:							
<p>This course introduces students to the concept of smart furniture production and intelligent making as it relates to the sustainable use of production technologies in furniture industry. This course is focused on direct experimentation and investigation of the various types of furniture production technologies including batch, serial and personalized furniture production. In addition, this course emphasizes on the importance of the prototyping concept as an industry standard method of presenting a proportional, stable and functional furniture piece. An inquiry research about local furniture industry is developed within the course and a prototype model is produce at the end of the semester.</p>

IDES466	Waste Management	8	IDES366	2	1	2	0
Course Aims		<ol style="list-style-type: none"> 1- To raise students awareness about the necessity of waste management process in interior transportation space to produce clean atmosphere, to create eco-friendly environment and to insure a life quality for the inhabitants 2- To introduce students to the waste management process in interior design from collection, to sorting to recycling/discarding phases 3- To equip students with technical skills to produce technical drawings showing waste flow in interior transportation spaces 4- To familiarize students with relevant sustainability standards and codes regarding waste management 					
Course Description:							
<p>This course is a theoretical framework aiming to raise the students' awareness about the environmental approaches in adaptive transports projects focusing mainly on the adequate waste management in these interior atmospheres and its positive impact on the life quality of its users considering economic, social, cultural and health contexts. Throughout this course, students are introduced to waste management process in interior design from collection, to sorting to recycling/discarding phases and its great advantages to create clean and eco-friendly atmospheres. Sustainability standards and codes are highlighted within this course to accentuate the green approach of interior design. After fulfilling this course, students are able to produce technical drawings showing waste flow in interior transportation spaces.</p>

					L	ST	Lab
IDES467	Event Planning Project	8	IDES462	2	0	4	0
Course Aims		<ol style="list-style-type: none"> 1-To raise the students awareness about the aesthetical sense of event planner when designing the set in order to select the event theme including the choice of the color palette, textiles, decorative lights and furnishings 2-Introduce students to the creative precedent event planner works and ability to appraise and judge these designs 3-To develop the students understanding and basic proficiency in a wide range of processes including set design, lighting and sound 					

design, planning, scheduling and budgeting, and event management

4-To equip students with the technical skills to record exact measurement from the event venue in order to produce scaled technical documentation for the projects

5-To develop the students capability of implementing a systematic design process to respond to the event type, event participants' needs and site constraints in order to generate innovative design ideas

6-To familiarize students with team work through the collaboration with different event planning team such as the event director, the coordinators of the program, the venue, the equipment, the promotions, the hospitality and the merchandising

7-Enhance the students' visual and verbal communication skills through the production of the storyboard, the furnishing plan, the technical drawings and the Computer Generated images

Course Description:

The course introduces the design process of event planning project to respond to the event type, clients' needs and site constraints in order to generate innovative design ideas. The selected event theme should compile with the choice of the color palette, textiles, decorative lights and furnishings which promote the aesthetical senses of the student. This course investigates the basic proficiency skills of students in various aspects including set design, lighting and sound design, planning, scheduling and budgeting, and event management. Before beginning the design, the student shall be introduced to the creative precedent event planner works to be able to appraise and judge their designs and produce an original design idea. The students will be given an event type (Birthday Party, Weddings, Celebrity/Artiste show, Conference/Seminar, Corporate Event, Exhibitions and Trade Fairs, Fashion Shows, Product Launches, street festivals...), event participants' profiles and pre-defined event venue for which they are requested to record the exact measurements in order to produce scaled technical documentation for the projects. The students contribute, throughout this course, with different event planning team such as the event director, the coordinators of the program, the venue, the equipment, the promotions, the hospitality and the merchandising ; in order to come up with a consistent event scene. Storyboard, the furnishing plan, the technical drawings and the Computer Generated images will be developed to document and present the design project. Discussion, critiques and jury, field trip and investigation of similar environments will be conducted.

					L	ST	Lab
IDES468	Modular Furniture Project	8	IDES464	2	0	4	0
Course Aims	<p>1-To raise the students awareness about the aesthetical sense of furniture designer when designing the product piece/series by selecting an concept /theme used in their designs</p> <p>2-Introduce students to the creative precedent furniture designers' works and ability to appraise and judge these designs</p> <p>3-To develop the students understanding and basic proficiency of furniture industry processes including furniture production, manufacturing and packing</p> <p>4-To equip students with the technical skills to produce scaled and detailed working drawing documentation for modular furniture projects</p> <p>5-To develop the students capability of implementing a systematic design process to respond to the furniture type, product multi-functionality, users' profiles and needs and limited budget constraint in order to generate innovative design ideas</p> <p>6-To familiarize students with team work through the collaboration with different industrial parties and local material suppliers</p> <p>7-To introduce students to specialized furniture software such as BOM Browser, Solid Works and CAD pro furniture design</p> <p>8-To enhance the students' visual and verbal communication skills through the production of the prototype model, the technical drawings, product specification document and bill of quantity</p>						
Course Description:	<p>The course introduces the design process of furniture project to respond to the furniture type, users' profiles and needs and limited budget constraint in order to generate innovative design ideas for modular furniture products. The selected design concept should compile with the choice of the color palette, textiles, raw and finishing materials and furniture accessories which promote the aesthetical senses of the student. This course investigates the basic proficiency skills of students in various aspects of furniture industry including processes of furniture production, manufacturing and packing. Before beginning the design, the student shall be introduce to the creative precedent furniture designers works to be able to appraise and judge their designs and produce an original design idea. The students are given a pre-defined furniture type with multi-functions, particular users' needs and limited budget constraint. Students are introduced to specialized furniture software such as BOM Browser, Solid Works and CAD pro furniture design in order to enhance their drafting and technical skills to produce scaled and detailed</p>						

working drawing documentation for furniture projects. The students contribute, throughout this course, with different industrial parties and local material suppliers; in order to come up with a modular, functional, smart and sustainable furniture piece/ series. Prototype model, the technical drawings, product specification document and bill of quantity will be developed to document and present the design project. Discussion, critiques and jury, field trip and investigation of similar environments will be conducted.

Course Code	Course Title	NQF Level	Pre requisite	CR.	Teaching Hours		
					L	ST	Lab
IDES469	Transformation Design Project	8	IDES466	2	0	4	0
Course Aims	<p>1-To raise the students awareness about the aesthetical sense of adaptive transport designer when designing the a rehabilitated/ used/ partially demolished transportation means by selecting an concept /theme used in their designs</p> <p>2-Introduce students to the creative precedent adaptive transport designers' works and ability to appraise and judge these designs</p> <p>3-To develop the students understanding and basic proficiency of adaptive transportation industry processes including reuse, recycling, rehabilitation and demolition principles as well as waste management</p> <p>4-To equip students with the technical skills to produce scaled and detailed working drawing documentation for transport adaptation projects</p> <p>5-To develop the students capability of implementing a systematic design process to respond to the transport typology, nomenclature, function, users' profiles and needs and limited budget constraint in order to generate innovative design ideas</p> <p>6-To familiarize students with team work through the collaboration with different industrial parties and local material suppliers</p> <p>7-To enhance the students' visual and verbal communication skills through the production of the prototype model, the technical drawings, product specification document and bill of quantity</p>						
Course Description:							
<p>The course introduces the design process of transport adaptation project to respond to the transport typology, nomenclature, function, users' profiles and needs and limited budget constraint in order to generate innovative design ideas for adaptive transports. The selected design concept should compile with the choice of the color palette, textiles, raw and finishing materials and accessories which</p>							

promote the aesthetical senses of the student. This course investigates the basic proficiency skills of students in various aspects of adaptive transport industry including reuse, recycling, rehabilitation and demolition principles as well as waste management. Before beginning the design, the student shall be introduced to the creative precedent adaptive transports' designers works to be able to appraise and judge their designs and produce an original design idea. The students are given a pre-defined transportation mean (marine, air, land) with multi-functions, particular users' needs and limited budget constraint. Students shall produce Computer Generated Images CGI and layouts in order to enhance their drafting and technical skills to produce scaled and detailed working drawing documentation for transport adaptation projects. The students contribute, throughout this course, with different industrial parties and local material suppliers; in order to come up with a functional, eco-friendly and recyclable transport interior environment. Prototype model, technical drawings, product specification document and bill of quantity are developed to document and present the design project. Discussion, critiques and jury, field trip and investigation of similar environments are conducted.

Open Elective Domain

IDES371	Interior Photography	7	IDES232	2	1	2	0
Course Aims	1- To enhance the students' skills of the photography techniques 2- To develop the students' skills of creating and selecting photographs to be posted in interior spaces. 3- To raise the perception about the importance of the photography in the domain of interior design.						
Course Description:							
<p>The course introduces general principles of achieving technically accurate photographs of interior spaces, furniture and room details. The course covers equipment and camera settings, lighting techniques, and editing solutions, shooting in the interior spaces within various angles in varying lighting conditions; using natural and artificial lights, retouching interior images through using various software tools. The students learn to select perfect scenes within the interior spaces in order to present the most interesting and esthetic photographs for the purpose of documenting the work of interior designers. To practice the challenge of photographing interior spaces, the course engages the students in real-life situation of taking photographs of different environments in order to add value and identity to the overall environment.</p>

IDES374	Islamic Interiors	7	IDES242	2	1	2	0
Course Aims	<ol style="list-style-type: none"> 1- To develop the student's awareness of Islamic art and materials 2- To enable students using emerging technologies to create innovative Islamic interiors. 3- To raise the students' awareness of Interiors design characteristics of most famous Islamic buildings. 4- To enable students analyzing the interior design of buildings in term of Islamic features and style. 5- To enable students to reuse the elements of Islamic arts in an innovating way to create and innovate designs in interior design and furniture 						

Course Description:

The course provides students with an overview on the Islamic Art principles including materials, Islamic architectural language, Islamic expressions in calligraphy, ceramics, metals, carpets. It introduces also the significant Islamic elements and features which influence on characteristic of Islamic interiors and formulate the Islamic style. The students will be able to design and analyze Islamic spaces based on the obtained background about the Islamic interiors and using emerging technologies.

IDES472	Healthcare Design	8	IDES212	2	1	2	0
Course Aims	1- To familiarize the students with the design considerations to be considered in the design of healthcare environments including the design brief, the technical constraints and structural specifications 2- To introduce the students to the design approaches and technological proprieties of healthcare environments 3- To raise the students' creative and technical skills on creating functional and innovative healthcare environments that fits with the guidelines and codes of such interior spaces						

Course Description:

The course introduces the design brief, the technical constraints and structural specifications that shall be considered in the design of healthcare environments. The course examines the design approaches and technological proprieties of this complex and sensitive environment and required methods of investigation and experimental studies. An interior design project of a healthcare environment that fits with its guidelines and codes will be conducted; it will be derived from a real life case of study. The design proposals will be presented to audience from the healthcare industry.
